Évora, 24th October 2023

ENEA's ACTIVITIES ON CSP/CST TECHNOLOGY

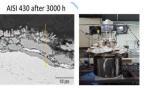

Molten salts tecnology

Thermal Storage

Heat for Industrial Processes

Solar Chemistry

Components qualification

Smart Sector integration

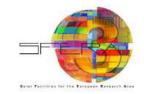

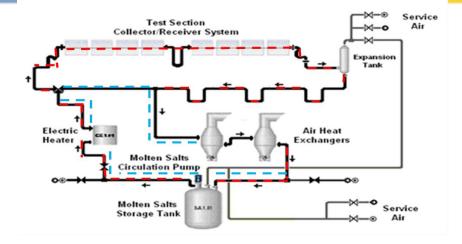

Évora, 24th October 2023

PCS facility

Fluid Type Salts mixture 40% KNO3 – 60% NaNO3	Description	values	u.m.
Flow rate min / max 4,5 / 6,5 kg/s Temperature min / max 270 /550 ° C Pressure pump delivery side 0,8 MPa Storage tank: 0,8 MPa diameter 2 m height 2,8 m design pressure 0,2 MPa electric heaters power 100 KW stored salts quantity 12000 Kg Heater max electric power 400 kW Air exchangers max thermal power 400 kW Test Section nominal length 100 m	Fluid Type	Salts mixture	
Temperature min / max 270 /550 ° C Pressure pump delivery side 0,8 MPa Storage tank: 0,8 MPa design temperature 2 m height 2,8 m design pressure 0,2 MPa electric heaters power 100 KW stored salts quantity 12000 Kg Heater max electric power 400 kW Air exchangers max thermal power 400 kW Test Section nominal length 100 m	40% KNO3 - 60% NaNO3		
Pressure pump delivery side 0,8 MPa Storage tank: diameter 2 m height 2,8 m design pressure 0,2 MPa electric heaters power 100 KW stored salts quantity 12000 Kg Heater max electric power 400 kW Test Section nominal length 100 m	Flow rate min / max	4,5 / 6,5	kg/s
Storage tank: diameter 2 m height 2,8 m design pressure 0,2 MPa electric heaters power 100 KW stored salts quantity 12000 Kg Heater max electric power 400 kW Air exchangers max thermal power 400 kW Test Section nominal length 100 m	Temperature min / max	270 /550	° C
diameter 2 m height 2,8 m design pressure 0,2 MPa electric heaters power 100 KW stored salts quantity 12000 Kg Heater max electric power 400 kW Air exchangers max thermal power 400 kW Test Section nominal length 100 m	Pressure pump delivery side	0,8	MPa

PCS facility

- •Built at ENEA Casaccia National Labs (Rome) technologies at 2003-2004
- 10 years of operation
- Experimental tests of various components
- •55,000+ hr operation in hot stand by condition
- 1400+ filling/draining cycles
- •9500+ hr operation with circulation of molten salts

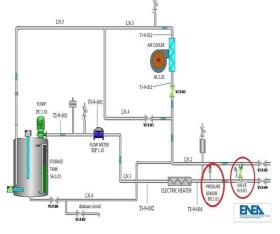

Évora, 24th October 2023

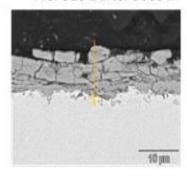

MoSE facility

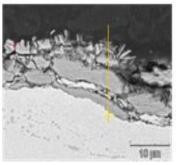

AISI 316 L after 3000 h

AISI 430 after 3000 h

Built at ENEA Casaccia National Labs (Rome) technologies at 2001 (The maximum flow rate of molten salts 0.5 - 1.3 kg/s, maximum operating temperature 550 °C and pressure 4 bar).

8000 hours of continuous operation

- dynamic corrosion resistance tests on structural with cyclical and long-lasting variations;
- sensor characterization tests;
- component qualification tests;
- thermo-fluid dynamic tests for molten salts fluid;

Solar Chemical laboratory

Experimental characterization thermophysical properties of materials: possible heat and onset of phase change, specific heat, viscosity, density, freezing point, Environmental safety and toxicity

etc.

A very important parameter is chemical stability of thermal fluids, both with respect to temperature and contact with other materials.

Being the relatively limited data in the literature in this area, the solar chemistry laboratory has dedicated particular attention to this topic, defining and applying specific criteria and experimental methodologies

System for studying the thermal stability of thermal fluids, up to approximately 650°C.

Évora, 24th October 2023

Thanks for the attention
